dAssets - Audit Report Executive Summary

Executive Summary

Project Name dAssets

Project URL https://deploy.finance/main

Overview

Deploy is a decentralized stablecoin system built around dUSD (a USDe-based stablecoin) with three main

components.

1. The dUSD contract is an ERC20 token with minting

capabilities restricted to a designated minter address.

2.StakedDUSDV2extends the base staking functionality with a flexible cooldown mechanism - when cooldown duration is zero, it operates as a standard ERC4626 vault with immediate withdrawals/redemptions; when cooldown is enabled (up to 90 days), it requires users to initiate cooldown periods via cooldownAssets() or cooldownShares() before claiming

through unstake().

3.DeployMinting serves as the core minting/redemption engine, managing collateral deposits and USDe issuance through cryptographically signed orders with role-based access control (minters, redeemers, collateral managers, gatekeepers). The system includes comprehensive rate limiting with per-block mint/redeem caps both globally and per asset, supports multiple collateral types including stablecoins with price deviation checks, and maintains custody wallet routing for collateral management. All components integrate with a silo-based architecture for

secure asset segregation during cooldown periods.

The scope of this Audit was to analyze the dAssets Smart Contracts for quality, security, and correctness.

The dAssets is a 100% fork of Ethena and our audit focused on diff.

Severity

dAssets - Audit Report Summary of Issues

Summary of Issues

No Issues Found

Checked Vulnerabilities

Arbitrary write to storage

Centralization of control

Ether theft

✓ Improper or missing events

Logical issues and flaws

Arithmetic Computations Correctness

Race conditions/front running

✓ SWC Registry

✓ Re-entrancy

✓ Timestamp Dependence

✓ Gas Limit and Loops

Exception Disorder

Gasless Send

Use of tx.origin

Malicious libraries

✓ Compiler version not fixed

Address hardcoded

Divide before multiply

✓ Integer overflow/underflow

✓ ERC's conformance

✓ Dangerous strict equalities

✓ Tautology or contradiction

Return values of low-level calls

✓ Missing Zero Address Validation	✓ Upgradeable safety
✓ Private modifier	✓ Using throw
✓ Revert/require functions	✓ Using inline assembly
✓ Multiple Sends	✓ Style guide violation
✓ Using suicide	✓ Unsafe type inference
✓ Using delegatecall	✓ Implicit visibility level

Techniques and Methods

Throughout the audit of smart contracts, care was taken to ensure:

- The overall quality of code
- Use of best practices
- Code documentation and comments, match logic and expected behavior
- Token distribution and calculations are as per the intended behavior mentioned in the whitepaper
- Implementation of ERC standards
- Efficient use of gas
- Code is safe from re-entrancy and other vulnerabilities

The following techniques, methods, and tools were used to review all the smart contracts:

Structural Analysis

In this step, we have analyzed the design patterns and structure of smart contracts. A thorough check was done to ensure the smart contract is structured in a way that will not result in future problems.

Static Analysis

A static Analysis of Smart Contracts was done to identify contract vulnerabilities. In this step, a series of automated tools are used to test the security of smart contracts.

Code Review / Manual Analysis

Manual Analysis or review of code was done to identify new vulnerabilities or verify the vulnerabilities found during the static analysis. Contracts were completely manually analyzed, their logic was checked and compared with the one described in the whitepaper. Besides, the results of the automated analysis were manually verified.

Gas Consumption

In this step, we have checked the behavior of smart contracts in production. Checks were done to know how much gas gets consumed and the possibilities of optimization of code to reduce gas consumption.

Tools and Platforms Used for Audit

Remix IDE, Foundry, Solhint, Mythril, Slither, Solidity Static Analysis.

dAssets - Audit Report Types of Severity

Types of Severity

Every issue in this report has been assigned to a severity level. There are five levels of severity, and each of them has been explained below.

Critical: Immediate and Catastrophic Impact

Critical issues are the ones that an attacker could exploit with relative ease, potentially leading to an immediate and complete loss of user funds, a total takeover of the protocol's functionality, or other catastrophic failures. Critical vulnerabilities are non-negotiable; they absolutely must be fixed.

High (H): Significant Risk of Major Loss or Compromise

High-severity issues represent serious weaknesses that could result in significant financial losses for users, major malfunctions within the protocol, or substantial compromise of its intended operations. While exploiting these vulnerabilities might require specific conditions to be met or a moderate level of technical skill, the potential damage is considerable. These findings are critical and should be addressed and resolved thoroughly before the contract is put into the Mainnet.

Medium (M): Potential for Moderate Harm Under Specific Circumstances

Medium-severity bugs are loopholes in the protocol that could lead to moderate financial losses or partial disruptions of the protocol's intended behavior. However, exploiting these vulnerabilities typically requires more specific and less common conditions to occur, and the overall impact is generally lower compared to high or critical issues. While not as immediately threatening, it's still highly recommended to address these findings to enhance the contract's robustness and prevent potential problems down the line.

Low (L): Minor Imperfections with Limited Repercussions

Low-severity issues are essentially minor imperfections in the smart contract that have a limited impact on user funds or the core functionality of the protocol. Exploiting these would usually require very specific and unlikely scenarios and would yield minimal gain for an attacker. While these findings don't pose an immediate threat, addressing them when feasible can contribute to a more polished and well-maintained codebase.

Informational (I): Opportunities for Improvement, Not Immediate Risks

Informational findings aren't security vulnerabilities in the traditional sense. Instead, they highlight areas related to the clarity and efficiency of the code, gas optimization, the quality of documentation, or adherence to best development practices. These findings don't represent any immediate risk to the security or functionality of the contract but offer valuable insights for improving its overall quality and maintainability. Addressing these is optional but often beneficial for long-term health and clarity.

dAssets - Audit Report Types of Issues

Types of Issues

Open

Security vulnerabilities identified that must be resolved and are currently unresolved.

Acknowledged

Vulnerabilities which have been acknowledged but are yet to be resolved.

Resolved

These are the issues identified in the initial audit and have been successfully fixed.

Partially Resolved

Considerable efforts have been invested to reduce the risk/impact of the security issue, but are not completely resolved.

dAssets - Audit Report Severity Matrix

Severity Matrix

Impact

Impact

- High leads to a significant material loss of assets in the protocol or significantly harms a group of users.
- Medium only a small amount of funds can be lost (such as leakage of value) or a core functionality of the protocol is affected.
- Low can lead to any kind of unexpected behavior with some of the protocol's functionalities that's not so critical.

Likelihood

- High attack path is possible with reasonable assumptions that mimic on-chain conditions, and the cost of the attack is relatively low compared to the amount of funds that can be stolen or lost.
- Medium only a conditionally incentivized attack vector, but still relatively likely.
- Low has too many or too unlikely assumptions or requires a significant stake by the attacker with little or no incentive.

dAssets - Audit Report Automated Tests

Automated Tests

No major issues were found. Some false-positive errors were reported by the tools. All the other issues have been categorized above according to their level of severity.

Closing Summary

This engagement provided a focused review of the differences introduced in this project compared to the original Ethena labs USDe protocol codebase.

The audit identified no vulnerabilities within the **scoped** changes.

Disclaimer

At QuillAudits, we have spent years helping projects strengthen their smart contract security. However, security is not a one-time event—threats evolve, and so do attack vectors. Our audit provides a security assessment based on the best industry practices at the time of review, identifying known vulnerabilities in the received smart contract source code.

This report does not serve as a security guarantee, investment advice, or an endorsement of any platform. It reflects our findings based on the provided code at the time of analysis and may no longer be relevant after any modifications. The presence of an audit does not imply that the contract is free of vulnerabilities or fully secure.

While we have conducted a thorough review, security is an ongoing process. We strongly recommend multiple independent audits, continuous monitoring, and a public bug bounty program to enhance resilience against emerging threats.

Stay proactive. Stay secure.

About QuillAudits

QuillAudits is a leading name in Web3 security, offering top-notch solutions to safeguard projects across DeFi, GameFi, NFT gaming, and all blockchain layers. With seven years of expertise, we've secured over 1400 projects globally, averting over \$3 billion in losses. Our specialists rigorously audit smart contracts and ensure DApp safety on major platforms like Ethereum, BSC, Arbitrum, Algorand, Tron, Polygon, Polkadot, Fantom, NEAR, Solana, and others, guaranteeing your project's security with cutting-edge practices.

7+ Years of Expertise	1M+ Lines of Code Audited
50+ Chains Supported	1400+ Projects Secured
